Seasonal-to-Decadal Predictions of Arctic Sea Ice ...

Arctic sea ice, oceans, and the atmosphere is hampering accurate predictions, even as the demand for them has increased For example, seasonal outlooks from 21 research groups all underestimated the drop in the extent of summer sea ice that was measured in September 2012 Establishing

Canada's Changing Climate Report - Chapter 5: Changes in ...

Perennial sea ice in the Canadian Arctic is being replaced by thinner seasonal sea ice (very high confidence) Summer sea ice area (particularly multi-year ice area) declined across the Canadian Arctic at a rate of 5% per decade to 20% per decade since 1968 (depending on region); winter sea ice area decreased in eastern Canada by 8% per decade

to subsequent austral winter sea ice anomalies, suggesting some preconditioning by the ocean Conversely, austral spring-summer sea ice anomalies in 2015/16 were spatially consistent with up-per ocean salinity anomalies in the subsequent austral summer-fall, suggesting that net spring sea ice melt was a strong influence on upper ocean

Executive Summary of Canada's Changing Climate Report

Observed changes in snow and ice features across Canada present a coherent picture of a warming climate: fall and spring snow cover, the duration of seasonal lake ice cover across the Arctic, and summer sea ice extent have decreased; glaciers have thinned; and permafrost has warmed These changes in the cryosphere
